

Open-Coniferous Bog Wetlands Type 8

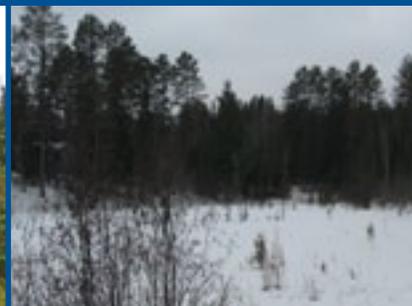

Spring

Summer

Fall

Winter

Function and Values

Open-coniferous bog wetlands provide important habitat for such wildlife as moose, deer, black bear, beaver, lynx, fishers, showshoe hare, and otter because the land is generally undisturbed. Migratory birds use bogs on their flight paths to breed, nest and feed. Bog wetlands are often valuable as reservoirs for streams (especially trout streams) and habitat for many unique plants.

Other uses of bogs include harvesting of sphagnum moss, aesthetics, and conversion to commercial cranberry and wild rice production.

Water Quality

Flood Control

Erosion Control

Habitat

Vegetation

Open bog vegetation is woody or herbaceous or both. Typical plants are heath shrubs, sphagnum moss, and sedges. In the north, leatherleaf, labrador tea, cranberries, carex, and cottongrass are often present. Although scattered, black spruce and tamarack also occur in open bog wetlands, but their growth is stunted. In coniferous bog wetlands, the plant communities are similar except with mature trees of black spruce and tamarack dominating the area.

Submergent and floating – vegetation requiring complete immersion, and are rooted in the bottom or free floating with majority of the leaves floating on the surface;

Emergent – rooted vegetation where most of the plant material is above the water surface; water levels must fluctuate for proper growth and seed germination (usually during drawdown in late summer);

Herbs and forbs – broad-leaved plants that typically grow either in the shallow water edges of wetlands, or ponds, and streams;

Shrub – woody vegetation that is less than 20 feet tall with single or multiple stems; species can be broad-leaved deciduous, or broad-leaved evergreen;

Tree – woody vegetation that dominate forested wetlands and is greater than 20 feet tall.

Black Spruce

Tamarack

Swamp Birch

Sphagnum Moss

Bog Sedge

Labrador Tea

Leatherleaf

What is a Wetland?

Wetlands are among the most productive ecosystems in the world and a source of support for all of the major groups of biological organisms.

By most standards, a wetland has mostly wet soil, is saturated with water either above or just below the surface, and is covered with plants that have adapted to wet conditions. A wetland is a term to describe a wide variety of wet environments from a slight depression, which holds water after spring runoff, to a forested swamp with peat soils.

The identification of wetlands can be difficult and it may be necessary for the landowner to hire a consultant to identify wetland boundaries. A consultant can also help with wetland replacement and permitting requirements.

Characteristics

Bogs are one of the most distinctive kinds of wetlands, and are characterized by a growth of evergreen trees and shrubs and a floor covered by a thick carpet of sphagnum moss. Bogs form in very wet places. Some have considerable amounts of open water surrounded by floating boggy vegetation; in others, vegetation may have completely filled a lake.

Bog wetlands soil is usually waterlogged and supports a spongy covering of mosses. This type occurs mostly in shallow basins, on flat uplands, and along sluggish streams.

Sequencing

Prior to any draining, filling or excavating in a wetland, proposed impacts to nonexempt wetlands must undergo a process known as sequencing. Sequencing is a step-by-step process that must be followed for clearly defined projects that intend to impact wetlands and reviewed to assess the efforts made by the applicant to follow these principles: avoidance, minimization, reduction or elimination of impacts over time, and replacement. Therefore, a Local Government Unit (LGU) may not consider or approve a wetland replacement plan unless the LGU finds that the applicant has demonstrated the activity impacting the wetlands has complied with all of the following principals in ascending order:

1. Avoiding Impacts

The first priority is to avoid impact to a wetland. If a project can be redesigned or relocated to eliminate any wetland impact, you must select this option.

2. Minimization

If St. Louis County determines that wetland impacts are unavoidable, you must then demonstrate that the project minimizes wetland impacts to the greatest extent possible. The county will determine if sufficient effort was made to minimize impacts by considering:

- The purpose of the project
- Size requirements of the project
- Location
- Sensitivity of the site design to the natural features of the site, including topography, hydrology, and existing vegetation

- The function and value of the wetlands on the site
- Applicants efforts to show alternatives to modify the size and scope of the project

3. Rectification

There may be times that a wetland impact is not possible to avoid, but the impact either is temporary or results in no net loss of wetlands. Temporary impacts may be approved by the county if the activity is completed and the physical characteristics of the wetland are restored within six months from the start of the activity. An example would be the construction of a temporary road through a wetland that is needed for a short term project. Once the project is completed, the road is removed. A performance bond would need to be provided to the county for an amount sufficient to cover the cost of restoring the wetland to pre-project conditions.

4. Reduction or Elimination of Impacts Over Time

Further impacts from draining or filling must be reduced or eliminated by managing the project in a manner that preserves remaining wetland functions and values. The county must require the applicants to implement Best Management Practices (i.e. silt fences) to protect wetland functions and values.

5. Replacement

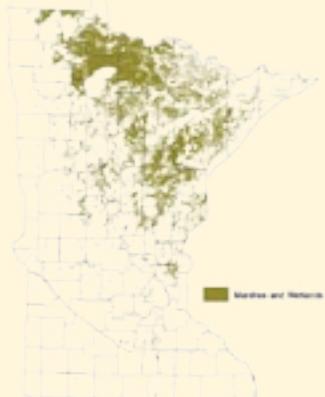

Replacement wetlands must replace the functions and values that are lost from a wetland that is drained or filled. Replacement of wetland functions and values may occur at more than one location.

Conservation Level

In both shoreland and nonshoreland areas, open-coniferous bog wetlands are in the high protection level and have impacts limited to 400 square feet. To the extent that a local shoreland management ordinance is more restrictive than 400 square feet, the local shoreland ordinance applies.

Wetland Areas in Minnesota

This map illustrates the concentrated amount of wetlands present in northern Minnesota when compared to the amount of wetlands throughout the remainder of the state emphasizing the need for wetland conservation.

Typical Impacts

- Filling:** adding any material to change the bottom level of a wetland;
- Draining:** removing the water from a wetland by ditching, tilling, pumping, or other such techniques;
- Excavating:** dredging and removing soil and vegetation from a wetland;
- Diverting water:** preventing the flow of water into a wetland by removing water upstream, lowering lake levels, or lowering groundwater tables;
- Clearing:** removing vegetation by digging or scraping;
- Flooding:** raising water levels, either behind dams or by pumping or otherwise channeling water into a wetland so that water levels are too high for wetland vegetation and animals to survive (i.e., converting a wetland to a lake or pond);
- Diverting or withholding sediment:** trapping sediment through the construction of dams, channelization or other such projects that inhibit the regeneration of wetlands in natural areas of deposition, such as deltas;
- Shading:** placing pile supported platforms or bridges over wetlands, causing vegetation to die;
- Conducting activities in adjacent areas:** disrupting the interactions between wetlands and adjacent land areas, or indirectly impacting wetlands through activities at adjoining sites.

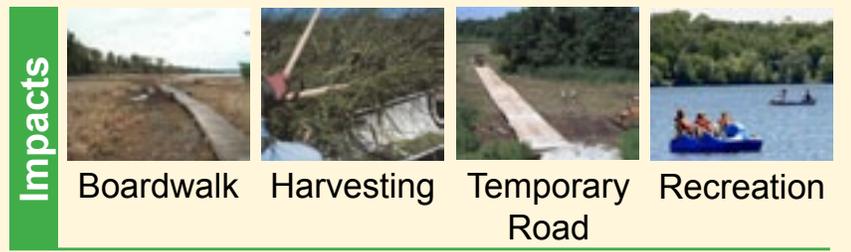

Do's

Rather than draining or filling wetlands, seek compatible uses involving minimal wetland alteration, such as waterfowl production, fur harvest, hay and forage, wild rice production, hunting and trapping leases, and selective timber harvest.

Maintain wetlands and adjacent buffer strips as open space.

Encourage neighbors, developers, and state and local governments to protect the function and value of wetlands in your watershed.

Select upland rather than wetlands sites for development projects and avoid wetland alteration or degradation during project construction.

Don'ts

St. Louis County Contact Information

Wetland Administration, Technical Assistance & Enforcement

Primary Contact for all Wetlands Issues

Contact these agencies **FIRST** if you suspect wetlands exist, to request a review, or obtain necessary permits for projects that may affect wetlands.

After working with primary contacts, try these agencies for additional technical assistance.

St. Louis County Planning and Community Development

Local administrators of the Minnesota Wetland Conservation Act. Provides plan and site reviews for wetland determinations, delineations, banking and replacement. Coordinates enforcement with DNR.

About the Guide

This guide is designed to give general information about wetland regulations, identifying wetland areas, common species, and impacts to wetland areas for residents, contractors, and professionals associated with wetland property.

St. Louis County has over 1,000 lakes, countless rivers and streams, and hundreds of thousands of acres of wetlands that provide recreational opportunities to both residents and tourists.

Obtaining the Guide

Copies of this guide are available free to all residents. Requests for a large number of guides should be directed to St. Louis County Planning and Community Development and may be charged a minimal fee to cover printing and production costs. All requests should be directed to:
